Research Question

To what extent does an aging population create an investment opportunity for purpose-built senior rental housing in a selected Ontario market, and what conditions would make a development financially viable?

Product and Services Definition

Newly developed, purpose-built rental housing designed with older residents in mind. Independent living, with no on-site care or meal operation in the initial model, in the interests of keeping real estate operating economics manageable.

Geographic Considerations

Primary market: Clarington municipality in the Regional Municipality of Durham, ON, Canada.
Wider context: Durham Region and nearby communities, where relevant. Given that residents can move across municipal boundaries, Clarington alone may be too narrow a catchment.

Investment Perspective

Primarily that of a real estate developer or equity investor; lender perspective as a secondary test. Inquires as to the connection between development feasibility, investment, and credit.

Time Horizon & Intended Audience

A 10-year illustrative hold, including construction and lease-up. This horizon is long enough to facilitate model development, stabilization, and exit without excessive forecasting detail.

Investment and credit professionals and corresponding organizations, looking for nuanced insights concerning demographic trends and resulting investment implications, alongside an exposition of risk-mitigatory considerations and operational constraints.

Investment Thesis

Demographic trends corresponding to a growth in older households may support demand for accessible, appropriately located rental housing. However, the investment case depends on whether sufficient households can and will rent the product at a price that supports development costs and the investor's required return.

The thesis involves five working parts:

1. **Demographics**: The relevant older population or household base grows.
2. **Housing choice**: Some of those households prefer or need the proposed product.
3. **Affordability**: Enough prospective households can pay the required rent.
4. **Competition**: The development can capture a realistic share of demand alongside alternatives.
5. **Economics**: Achievable rents and occupancy support the required returns after all costs and financing.

Counter Thesis

Alternative explanations and negative findings may involve the following scenarios:

- Many older residents may prefer to remain in their existing homes.
- Renters may choose conventional apartments rather than a senior-oriented building.
- Existing and proposed developments may satisfy much of the demand.
- A desired product may require rents above what enough local households can afford.
- A project can generate positive operating income whilst falling short of the return required to justify development risk.
